Dentist AI Talking Video Prompt – Universal Version

Purpose
This guide helps dentists turn any single photo into a highly realistic talking AI video using Flow. It works with any language, any accent, and any country, as long as the photo is clear.

Step 1 – Reference Image (Identity Lock)
Use the provided image as the absolute identity reference. The person must remain 100% identical to the original photo. Do NOT change facial features, bone structure, age, skin texture, or proportions. No beautification, no AI smoothing, no plastic skin, no stylized look.

Step 2 – Photo Quality Rules
• Face fully visible
• Natural or neutral expression
• No sunglasses or hands covering face
• No extreme side angles
• Natural light preferred
• Phone selfie is enough

Step 3 – Camera & Framing Rules
• Chest-up or shoulders-up framing
• Fixed camera, no zoom or movement
• Eye-level angle
• Natural environment (clinic, office, home, café, neutral wall)
• No filters or cinematic effects

Step 4 – Language & Voice
Language must be exactly as provided by the user. Accent must be natural, educated, professional, and region-appropriate. If pronunciation sounds unnatural, regenerate with slower pace and clearer articulation.

Step 5 – Script-to-Prompt Logic
Each sentence of the script becomes one short video clip. Describe facial expression, eye contact, micro movements, and calm dentist body language for each clip.

Step 6 – Flow Rules
Flow does not remember previous prompts. Repeat identity, camera, voice, and body language rules for every clip. One prompt equals one clip.

Step 7 – Continuity for Multiple Clips
End each clip with a neutral pose. Start the next clip from the same posture. Avoid sudden jumps in expression or position.

Psychology Rule
The goal is believability. If it feels like a real dentist speaking calmly to a patient, the mission is successful.

Final Reminder
No effects. No AI look. No overacting. Real beats perfect. Calm beats cinematic. Trust beats everything.
